

INNOVATIVE and AUSTRALIAN

CHLORPYRIFOS G

Insecticide in granular formation

Barmac CHLORPYRIFOS G is a granular formulation of this widely used insecticide. The product is registered for use on all turf situations, including golf and bowling greens, and fairways. The granular formulation offers a number of benefits over the liquid counterparts, and is suitable for application through a rotary style fertilizer spreader.

WHY USE GRANULAR INSECTICIDES?

- Granular insecticides are easier to handle and use because they are pre-mixed and do not involve the use of complex spray equipment.
- Application costs are significantly less as there is no need for expensive machinery pumps, nozzles and related equipment.
- Because of the small dense nature of the granule, the risk of spray-drift becomes insignificant.
- There is no need for extensive safety equipment when handling and applying.
- The safety directions only require the use of a dust mask and gloves.
- As there is no need to cart water using heavy machines, the product can be applied even to wet greens or during rain periods.

- Improved public relations as application is less visible to members and players and the odours are reduced.
- The risk of foliar tie up of the chemical is reduced and the loss due to photodegradation, which is common with Chlorpyrifos, is lessened.

Barmac **CHLORPYRIFOS G** has the active ingredient bonded to an inert granular particle. Once the product is wetted the granule rapidly breaks down, releasing the chemical to move onto the soil surface and perform in an identical way to the standard liquid formulations.

CHLORPYRIFOS G is also ideal for application by hand to small areas like ants nests or localised infestations of black beetles.

Pack Size:

Available in a 10kg plastic pail, which will treat 5000m² or three standard bowling greens at label rates. (200 grams per 100m²).

When applying through a Scott's fertilizer spreader use setting 8E.
